

STETZERiZER® Filter Installation

STETZERiZER® Filters are very easy to install on your own. Approximately 15 filters may be required for the average home. Follow these instructions to maximize filter effectiveness.

Note: Many homes may not have enough open outlets to install the number of filters needed to clean up the home. If this is the case, purchase several power strips, plug your electronic devices into them, and install filters in the power strips as per the instructions below.

One filter should be installed in power strips where each of the following electronic devices is located:

- Hair Dryer
- Mixer
- Blender

Two filters should be installed in power strips where each of the following electronic devices is located:

- Personal Computer
- Laptop Computer
- Inkjet Printer
- Fax Machine
- Personal/Home Office Copier
- Entertainment Center (TV, VCR, DVD, Stereo, etc.)

Three filters should be installed in power strips where each of the following electronic devices is located:

- Laser Printer
- Large Office Copier

One filter should be installed in an outlet on each wall of the rooms you spend the most time in, especially bedrooms. Other rooms where this should be done may include your living room, kitchen, study, etc.

At least one filter should be installed in an outlet as close as possible to the main electrical panel in your home. Installing a filter in this outlet will clean up the power coming into the house from outside.

We strongly recommend that you use a **STETZERiZER®** Microsurge Meter to ensure that you have installed sufficient filters. You should be aware that you are cleaning up your home one power circuit at a time, not necessarily on outlet at a time. Once you have installed your filters check the reading on the meter and compare with the guidelines on the back of the meter and install more or less filters as required to reach the optimal meter reading. Make sure that you turn on all possible appliances when taking your final readings to ensure that you are getting a true maximum reading. Measure any new appliances after you have install them to ensure you are still safely within guidelines.
